Outline

1 Problem

2 Solution

Problem Statement

(ICSE Class 12, Exercise 11.B) solve $\sin x \frac{dy}{dx} - y = \sin x \cdot \tan \frac{x}{2}$

Solution

- $\sin x \cdot \frac{dy}{dx} - y = \sin x \cdot \tan\left(\frac{x}{2}\right)$
- $\frac{dy}{dx} - \frac{y}{\sin x} = \tan\left(\frac{x}{2}\right)$
- integral factor of the above equation is $1/\tan(x/2)$
- $\frac{y}{\tan\left(\frac{x}{2}\right)} dx = \int \tan\left(\frac{x}{2}\right) \frac{1}{\tan\left(\frac{x}{2}\right)} + c$
- $\frac{y}{\tan\left(\frac{x}{2}\right)} = x + c$
- $y = x \cdot \tan\left(\frac{x}{2}\right) + c \cdot \tan\left(\frac{x}{2}\right)$
